

Compass System

Compass System

Official Name

Compass System

Product Type

Travel planning and management system composed of:

- Mobile application
- Backend server
- Administrative web platform

Product Overview

The **Compass System** is a travel planning platform designed to facilitate the connection between **clients** and **travel agents**.

The system captures a client's travel interests, destinations, and preferences through a **mobile application**. These data are sent to a **server** and later managed by travel agents through an **administrative web interface**.

Travel agents use this information to organize travel logistics such as:

- Itineraries
- Accommodations
- Transportation
- Reservations
- Travel stops

The goal is to create **personalized travel experiences for clients**.

Product Objective Goals & Target Users

Main Goal

Simplify the **communication and planning process between clients and travel agents**.

Target Users

Clients

People who want to:

- Plan trips
- Define travel interests
- Follow their travel experiences through a **mobile application**

Travel Agents

Professionals responsible for:

- Organizing trips
- Managing logistics

- Creating itineraries through a **web-based administrative platform**
-

System Concept

The system works in two main stages:

1. Client Stage

- The client defines travel interests and routes through the mobile application.

2. Agent Stage

- Travel agents transform the client's route into a structured itinerary.

The client can then **follow the itinerary during the trip through the mobile application**.

Core Concepts

Client

A user who wants to **plan and follow a trip** using the mobile application.

Travel Agent

A professional responsible for **organizing and managing the client's trip**.

Route (Travel Plan)

A **travel draft created by the client** that contains:

- Destination information
 - Travel dates
 - Points of interest
-

Itinerary

A **structured travel plan created by the agent** based on the client's route.

Includes:

- Travel stops
 - Accommodations
 - Reservations
 - Logistical details
-

RouteCraft

The **mobile application** used by clients to:

- Create travel routes
 - Follow their itineraries
-

Travel Matrix

The **web administrative system** used by travel agents to:

- Manage routes
 - Create itineraries
-

Server

The **central system** responsible for:

- Storing travel data
 - Synchronizing information
 - Connecting the mobile app and web platform
-

Design Principles

Simplicity

The system must be **easy to use** for both clients and travel agents.

Clear Role Separation

- **Clients** focus on travel interests.
 - **Agents** focus on logistical organization.
-

Data Synchronization

All travel data must be **consistently shared between the mobile app and the administrative system.**

Experience-Focused Design

The system should prioritize creating **memorable and well-organized travel experiences.**

Modular Architecture

The system is divided into independent modules:

- Mobile Application
 - Backend Server
 - Web Administrative Platform
-

MVP Goal

The MVP must allow:

1. **Clients to create a travel route through the mobile application**
2. **Travel agents to transform that route into a structured itinerary**

The itinerary must then be **available for the client to follow during the trip.**

MVP Features

Client Login

Purpose

Allow clients to access the **RouteCraft mobile application**.

User Actions

Client enters **login credentials** in the mobile app.

System Behavior

The system:

- Validates credentials
- Grants access to the client account

Feature Relationship

Connected with:

- Client account management
 - Trip creation
-

Agent Login

Purpose

Allow travel agents to access the **Travel Matrix administrative web system**.

User Actions

Agent logs in using **registered credentials**.

System Behavior

The system:

- Validates credentials
- Provides access to route management features

Feature Relationship

Required for:

- Client management
 - Itinerary creation
-

Client Route Creation

Purpose

Allow clients to **create a travel route** containing general trip information and points of interest.

User Actions

Client:

- Creates a **trip name**
- Defines **start date**
- Defines **end date**
- Defines **start location**
- Defines **destination**
- Adds **travel interests**
- Adds **geographic points**
- Confirms and submits the route

System Behavior

The mobile application:

- Sends the route data to the server
- Stores it for agent access

Feature Relationship

Provides the **base data required for itinerary creation**.

Agent Itinerary Creation

Purpose

Allow travel agents to create a **structured itinerary** based on a client route.

User Actions

Agent:

- Selects a **client route**
- Adds **travel stops**
- Adds **accommodation information**
- Adds **reservation details**
- Confirms the itinerary

System Behavior

The system:

- Stores the itinerary
- Links it to the client's route

Feature Relationship

Depends on:

Client Route Creation

Client Itinerary Visualization

Purpose

Allow clients to **view and follow the itinerary** created by the travel agent.

User Actions

Client:

- Opens **My Trips**
- Selects an itinerary
- Starts the trip when the **travel date arrives**
- Follows each **stop of the itinerary**

System Behavior

The application:

- Unlocks the itinerary on the **travel start date**
- Displays each stop with instructions and details
- Saves progress locally
- Synchronizes progress with the server

Feature Relationship

Depends on:

Agent Itinerary Creation

Navigation Flow

Client (Mobile App – RouteCraft)

Login

- My Trips
 - Create Trip
 - Submit Route
 - View Itinerary
 - Follow Travel Stops
-

Travel Agent (Web – Travel Matrix)

Login

- View Client Routes
 - Select Route
 - Create Itinerary
 - Save Itinerary
-

Core Data Structures

Client

- id
 - name
 - login_credentials
-

TravelAgent

- id
 - name
 - credentials
-

Route

- id
 - client_id
 - trip_name
 - start_date
 - end_date
 - start_location
 - destination
 - interests_list
-

InterestPoint

- id
 - route_id
 - name
 - description
 - geographic_location
-

Itinerary

- id
 - route_id
 - created_by_agent
 - list_of_stops
-

ItineraryStop

- id
 - itinerary_id
 - location
 - description
 - reservation_information
-

Out of Scope (MVP)

The following features **are not included in the MVP**:

- Automatic itinerary generation using AI
- Real-time travel tracking
- Payment processing for bookings

- Integration with hotel or airline APIs
- Social features between travelers
- Full offline synchronization system
